## **DRAGONFRUIT** — VIETNAM

We visited with the head of the Binh Thuan Province Farmers Association yesterday and snapped pictures of his young dragon fruit plants. These plants are 4.5 months old. SumaGrow® was applied 40 days ago.

The first picture (left) shows the plants on Komix, the top locally produced microbial product. The second picture (right) shows the plants on SumaGrow®. You can see that the SumaGrow®n plants are already much taller, some reaching or exceeding the top of the posts. This is unusual for plants of this age. It usually takes 10 to 12 months to reach this height.

We are now applying SumaGrow® to plants in the flowering and fruiting stages to see the effects on grown plants.
