

# TESTIMONIAL

## **FORAGE** — SCOTT PATTERSON, HOUSTON, TEXAS

Our farm is located in east Texas, and I grow 400 acres of hay as my primary source of income. I used {SumaGrow®} products for my last cutting of hay this past year on 120 acres. Our application for the 120 acres that we applied the {SumaGrow®} products to was two weeks behind the 280 acres that we used our normal fertilizer program on. Mr. Wade at the Bio Soil office had recommended that I cut my fertilizer program by ½ on the 120 acres; however, due to a misunderstanding, I did not use any conventional fertilizer on the 120 acres as I used only the {SumaGrow®} product at the rate of one gallon per acre.

The results were remarkable as we baled the entire 400 acres at the same time. Our normal production of baled hay (with small bales) was 50 bales per acre. The 120 acres produced 65 bales per acre. I felt that this was really remarkable, especially since it was two weeks behind the 280 acre application. The hay color and texture was more appealing, and the weight per bale was somewhat heavier. Please feel free to call if I can answer further questions as we are looking forward to using the {SumaGrow®} products this coming season.
