

TESTIMONIAL

VEGETABLE CROPS — INTERNATIONAL

A distributor for EarthCare Natural, SumaGrow® inside, reports in from Panama. The zucchini matured in 40 days instead of the normal 60ish days. Since they grow year round in Panama, this earlier maturation alone is equivalent to a 50% yield increase.

EarthCare also reports on a bok choy trial in California, applied and supervised by a third party, a major ag/chem distributor in the U.S. The crop matured in 36 days instead of the normal 45 days. Again, due to year round growing, this earlier maturation benefit is equivalent to a 25% yield increase. There was also an actual yield increase, fertilizer reduction and better taste.

Promised Land, using Genesis, SumaGrow® Inside, showed an increase in profit of over \$70/acre, without adding in the fertilizer reduction on soybeans.

From Italy, the Agriculture Institute, Prever-Osasco, performed multiple replicates on five different potato varieties, which averaged a 13.4% yield increase using Solum Natural, a Grow Pros label.

Tall Harvest in Vietnam reports good results on dragon fruits, coffee (both old and producing trees), black pepper, and pearl onions. And from Cambodia, a longan tree (similar to lychee, not to be confused with Loganberry) plantation owner loved the early results.
